

WEBEX-NOTIFIER

Pops a native macOS notification whenever you get a Webex DM or @mention. No Slack, no admin approval, no app to keep open.

REQUIREMENTS

- A Mac with python3 3.9+ (on it by default) + Terminal access.
- Your own Webex/Cisco login. No shared secrets, no IT ticket.

INSTALL (about 2 minutes, one time)

1. Copy or clone this folder anywhere, then in Terminal:
 `cd webex-notifier`
2. Run:
 `./run.sh`
3. It sets itself up automatically and interactively -- just follow the prompts:
 - Opens developer.webex.com to register YOUR OWN personal Webex Integration (~30 sec: name it anything, set Redirect URI to exactly `http://localhost:8734/`, check the 3 scopes shown on screen, paste back the Client ID/Secret it gives you).
 - Opens a browser to sign in with your Cisco email.
 - Fires a test notification, then installs a personal cron job that checks every minute.

NOTE - No banner on the test notification?

Open System Settings > Notifications > find "Script Editor" > turn on Allow Notifications, set style to Banners/Alerts (not None). Then run `./run.sh notify-test` again.

EVERYDAY COMMANDS

- | | |
|--------------------------------------|-------------------------------------|
| <code>./run.sh status</code> | Show auth + cron state |
| <code>./run.sh doctor</code> | Diagnose/fix problems interactively |
| <code>./run.sh check</code> | Run one check now (skip the wait) |
| <code>./run.sh notify-test</code> | Fire a one-off test notification |
| <code>./run.sh cron-uninstall</code> | Stop/remove the background check |

TROUBLESHOOTING OAUTH ERRORS

- "We've encountered an error. Try again later." -- almost always a redirect URI mismatch. Re-open your integration at developer.webex.com/my-apps and confirm the Redirect URI is EXACTLY `http://localhost:8734/` (note the trailing slash), then save and retry.
- "The requested scope is invalid." -- go back to the integration's Scopes section and make sure all three are checked: `spark:messages_read`, `spark:rooms_read`, `spark:people_read`. Save, then retry.

Each person registers their own Webex Integration and keeps their own tokens under `~/.webex_notifier/` -- nothing here is shared between colleagues, and there's nothing sensitive in this folder to protect when you pass it along.
